Let your income pay down your Bitcoin loan.

Receive MUSD, keep your operating cash, and automatically direct a chosen share toward your Mezo loan.

1 · PROBLEM

Borrowing against BTC is easy. Paying it back is a chore.

Manual
Owners must remember, size and send every repayment.

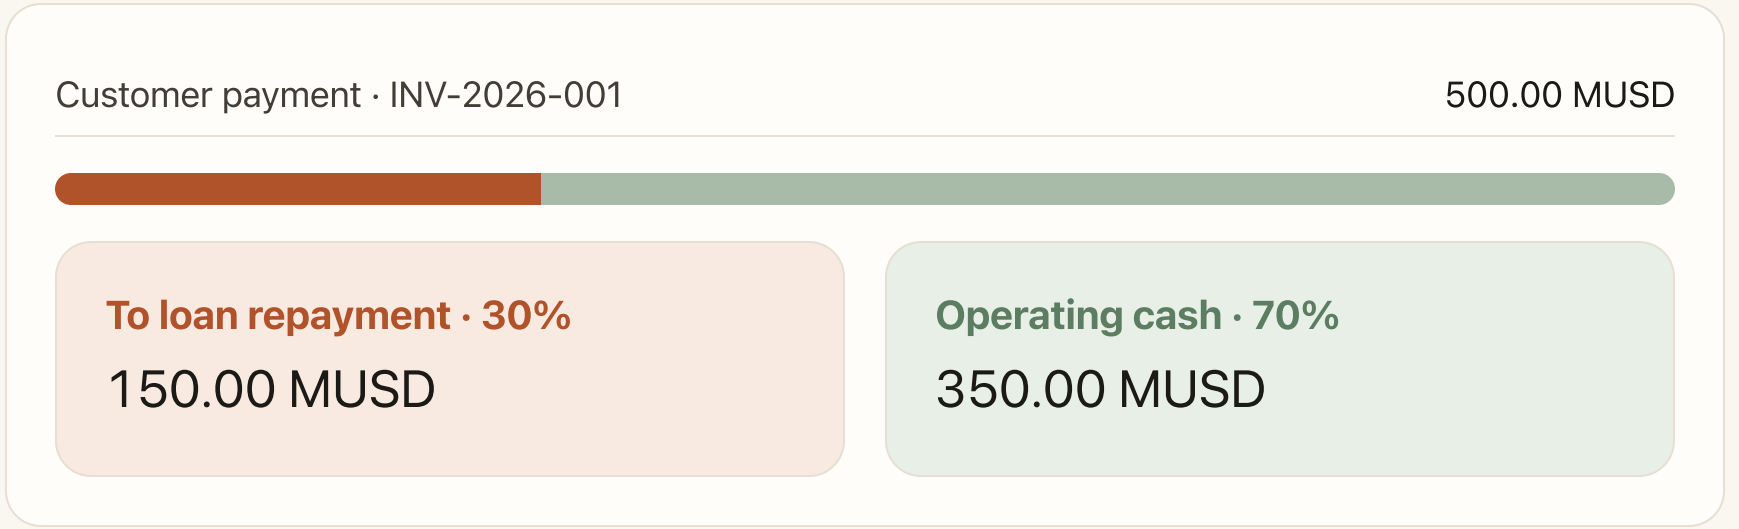

Competing for cash
Revenue lands in the same wallet as spending money.

Disconnected tools
Payment links don't repay loans; loan dashboards don't see revenue.

Who: freelancers, studios and agencies, and BTC-holding founders borrowing MUSD on Mezo.

2 · PRODUCT

Every payment is split once, the moment it arrives.

Real numbers from the live testnet run. Borrowed MUSD is never counted as income.

3 · USER FLOW

Five steps from wallet to automated repayment.

01
Create an account only your wallet controls

02
Account opens and owns a Mezo Trove

03
Set share, reserve, limits, cooldown

04
Share a payment link (approve or permit)

05
Keeper or owner repays; debt and ratio update

The account contract *is* the borrower.

- `BorrowerOperations`: openTrove, repayMUSD, closeTrove, addColl, withdrawColl, claimCollateral
- `TroveManager.getEntireDebtAndColl`: live debt including accrued interest
- Respects the **1,800 MUSD minimum net debt** and 200 MUSD gas compensation; caps repayment in-block
- MUSD EIP-2612 permit for one-transaction customer payments
- Liquidation, redemption, surplus claim and recovery mode handled

5 · SECURITY & ARCHITECTURE

Keepers can repay. Nothing else.

Keeper can

Call `executeRepayment`: repay this account's own Trove from pending income, within policy and Mezo's floor. Zero fee.

Keeper cannot

Borrow, withdraw collateral, touch operating cash, change owner/policy, pay anyone, or call arbitrary contracts.

Clones initialized atomically by an admin-less factory · nonReentrant everywhere · 61 Foundry tests incl. fuzz & invariants · fork test on real Mezo bytecode · Slither triaged · Sourcify exact match. Self-review, not an audit.

6 · WORKING EVIDENCE (MEZO TESTNET)

Real Trove, real payments, real debt reduction.

Account opened Trove · 0.045 BTC	debt 2,202.00 MUSD
Customer paid 500 MUSD (separate wallet)	150 → repayment
Keeper repaid (no special permissions)	2,202.00 → 2,052.00
Non-owner setPolicy on-chain	reverted · NotOwner()
Permit payment + classified direct transfer	income 555.00
Repayment capped at Mezo minimum debt	debt = 2,000.0000

7 · BUSINESS HYPOTHESIS & ROADMAP

Tie repayment to revenue, and debt falls on its own.

Hypothesis (unvalidated): businesses with recurring MUSD revenue will keep lower loan-to-value if repayment is automatic. Possible model: a small, capped share of repaid amounts.

Next
Hosted, redundant keeper with public status and capped owner-funded tips

Then
Owner-approved auto-close to retire the minimum-debt tranche

Later
Invoices, partial payments, exports; audit before mainnet
